Dear Deni Suwardhi,

Please find the review results of your abstract submission(s) below, including abstract submitted to ISPRS Archives, abstract-only contributions, and applied abstracts.

What's the next step?

If your abstract(s) are accepted for ISPRS Archives, please prepare the full paper by addressing all the comments from the reviewers and following the ISPRS Guidelines for authors preparing a full paper (https://www.isprs.org/documents/orangebook/app5.aspx). The deadline for submitting your camera-ready full paper is March 30, 2026. You will be able to upload your full paper after January 31, 2026.

For accepted abstract-only and applied-abstract submissions, a full paper is not required. However, in order for your submission to be included in the final program, authors of an accepted abstract are required to submit a properly formatted final revised version of the extended abstract by addressing reviewers' comments and following to the ISPRS Guidelines by March 30, 2026.

Please be reminded that at least one author of each accepted submission must register by the deadline of April 27, 2026 to be included in the program and/or proceedings; furthermore, a maximum of two (2) accepted submissions will be permitted per registered (full fee or reduced fee) co-author.

If you have not completed your congress registration, we encourage you to register as soon as possible. The early registration deadline ins March 2, 2026.

Contribution Details

ID: 1318
Title: Augmenting City Models with Handheld LiDAR and 3D Gaussian Splatting for Inclusive Pedestrian Infrastructure Assessment

Review Result of the Program Committee: This contribution has been accepted and will be published in the 2026 proceedings.
Your paper will be published in the ISPRS Archives of the Photogrammetry, Remote Sensing and Spatial Information Sciences (https://www.isprs.org/publications/archives.aspx), subject to the final camera-ready version.

One of the co-authors has to be registered to the 2026 ISPRS Congress for final publication of your paper.

Overview of Reviews

Review 1
========

Contribution of the Submission

This paper proposes a framework to integrate points cloud derived from handheld LiDAR and 3D Gaussian Splatting spheres calculated from a video taken by a 360-degree panorama camera. Although there are already some studies focus on the integration of LiDAR points cloud and 3DGS spheres, they usually take care of a large scale environment. This paper put its emphasis on the pedestrian environment. The author applies CityGML to describe the facility on the pavement, which makes it more applicable for VR applications.

Evaluation of the Contribution
---
*Innovation (15%): 6
Scientific formulation (10%): 8
Experiments and validation (15%): 8
Relevance (10%): 8
Quality of Presentation (10%): 8
Overall Recommendation (40%): 9
Total points (out of 100) : 81

Comments for the authors

The objective of this paper is clear and concrete. Integration of LiDAR and 3DGS for a better description of the environment has been a popular research topic in recent years. The proposed framework is resonable and the result shows the feassibility of the proposed framework. However, it would be more convicing if the author can describe more about the registration process of LiDAR points cloud and 3DGS spheres. Is it implimented by an ad-hoc program or an existing program?

Review 2
========

Contribution of the Submission

This work presents a hybrid workflow combining handheld LiDAR and 3D Gaussian Splatting (3DGS) from 360° video to create high-precision, photorealistic 3D models of pedestrian infrastructure within a CityGML framework. The integrated model supports immersive VR/MR-based accessibility assessments, enabling both geometric analysis (e.g., slope, curb height) and participatory evaluation by users such as wheelchair riders.

Evaluation of the Contribution
---
*Innovation (15%): 8
Scientific formulation (10%): 6
Experiments and validation (15%): 6
Relevance (10%): 6
Quality of Presentation (10%): 6
Overall Recommendation (40%): 7
Total points (out of 100) : 67

Comments for the authors

This submission presents an interdisciplinary approach that bridges geomatics, computer graphics, and inclusive urban design. The core idea of merging geometric precision with photorealistic immersion for accessibility assessment is forward-looking.
The methodology is described logically, and Figure 2 effectively summarizes the hybrid workflow. While, it heavily emphasizes the potential of the workflow. Quantitative results focus on the geometric accuracy of LiDAR but lack performance metrics for the integration itself (e.g., accuracy of the LiDAR-3DGS fusion). May consider to provide metrics comparing the fused model against the individual data sources.

Review 3
========

Contribution of the Submission

The submission puts forward a hybrid urban digital twin workflow that integrates handheld LiDAR, 360° video-based 3D Gaussian Splatting, and CityGML 3.0 semantics to enhance human-scale pedestrian infrastructure modelling.The contribution is to use 3D reconstruction techniques at a scale appropriate for pedestrians and to integrate them within a CityGML semantic framework for analysing urban accessibility.

Evaluation of the Contribution
---

*Innovation	(15%)	6
Scientific formulation	(10%)	6
Experiments and validation	(15%)	6
Relevance	(10%)	8
Quality of Presentation	(10%)	8
Overall Recommendation	(40%)	8
Total points (out of 100)		72

Comments for the authors

This abstract presents a valuable applied contribution to human-scale urban digital twins. However, the submission would be better if it had clearer definitions of the research questions and stronger explanations of what is truly novel, beyond just combining known technologies. The performance analysis is good, but it is only qualitative. If it were compared more rigorously with traditional workflows or single-sensor approaches, it would be a more significant scientific contribution.
